# Modul 3: Introduction to Machine Learning

Organized by:

# Module Overview

## Topics

- What is Machine Learning?
- Application of Machine Learning
- Machine Learning Approach
- Type of Machine Learning
- Machine Learning Steps
- Deep Learning

# Module Objectives

- Understand what is Machine Learning, and Its Applications.
- Understand how Machine Learning algorithm work.
- Understand different type of Machine Learning

# Our World Today

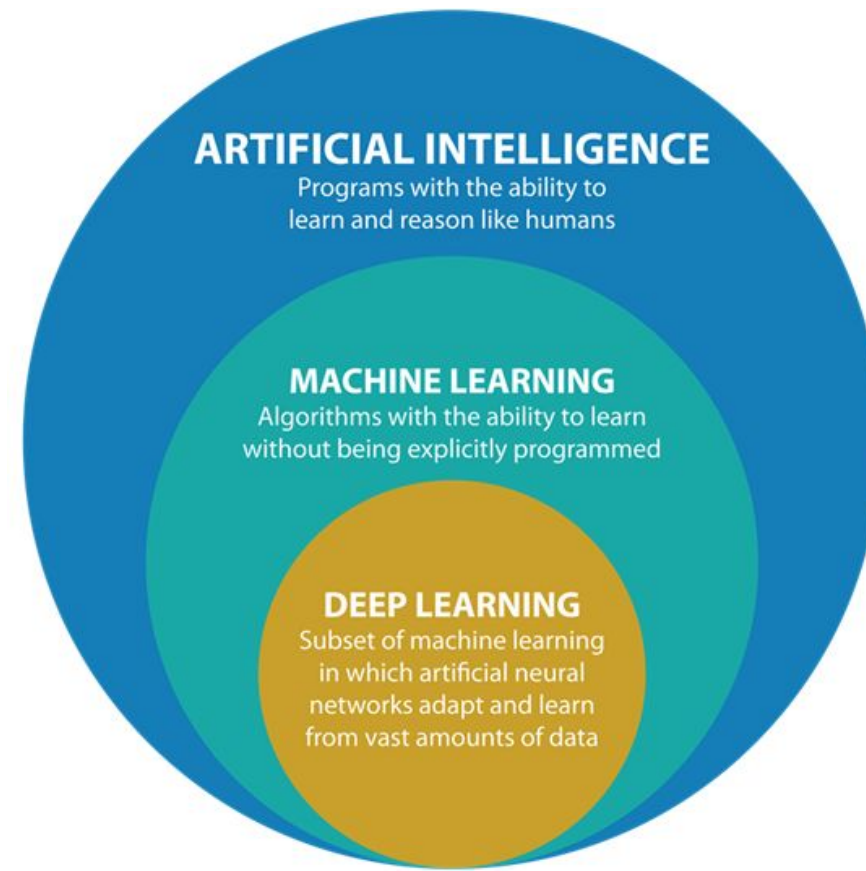

# What is Machine Learning?

# What is Machine Learning

- Machine Learning is a type of Artificial Intelligence (AI) that provides computers with the ability to learn without being explicitly programmed.

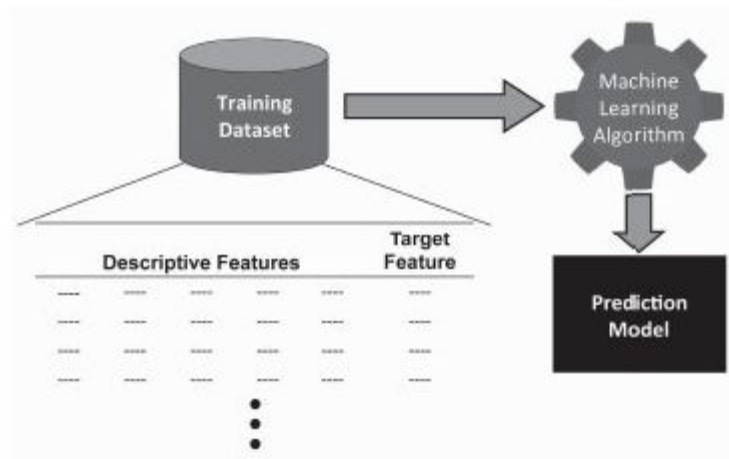

# What is Machine Learning

# What is Machine Learning

- Machine learning algorithms automate the process of learning a model that captures the relationship between the descriptive features and the target feature in a dataset.

Learning from historical data

Using model to predict a new data

# Using Data to Answer Question

- Machine Learning is an idea to learn from examples and experience, without being explicitly programmed.
- Instead of writing code, we feed data to the generic algorithm, and it builds logic based on the data given.

- Traditional Programming

- Machine Learning

# Why we need Machine Learning?

- Pattern Identification
- Process Automation

# Pattern Identification

Lama bekerja (Tahun)	Gaji (Rupiah)
2	3.000.000
4	6.000.000
6	9.000.000
10	15.000.000
12	24.000.000
14	28.000.000

# Pattern Identification

Lama bekerja (Tahun)	Gaji (Rupiah)
2	3.000.000
4	6.000.000
6	9.000.000
10	15.000.000
12	24.000.000
14	28.000.000

```
if (experience <= 10)
{ salary = experience * 1.5 * 1000000}
else if(experience >10)
{ salary = experience * 2 * 1000000}
```

# Pattern Identification

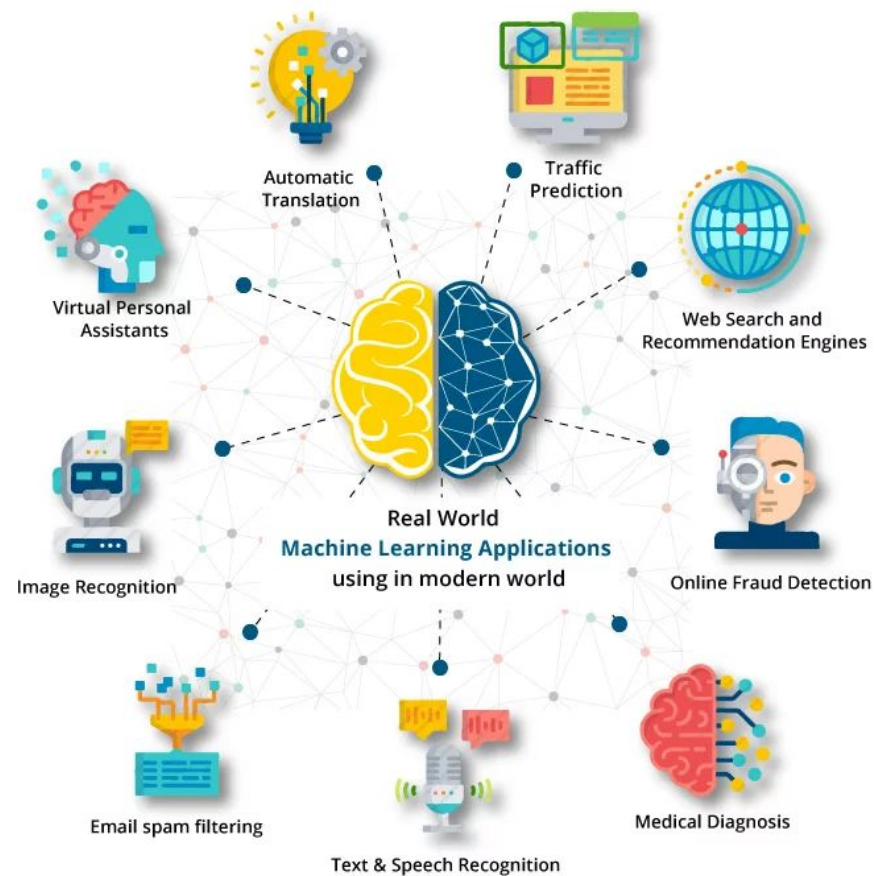

Lama bekerja	Level Pekerjaan	Pendidikan Terakhir	Gaji (Rupiah)
2	3	Yes	4.500.000
4	3	No	6.000.000
6	4	No	7.500.000
10	5	Yes	18.000.000
12	5	No	15.000.000
14	6	No	18.000.000

# Pattern Identification

Lama bekerja	Level Pekerjaan	Pendidikan Terakhir	Gaji (Rupiah)
2	3	Yes	4.500.000
4	3	No	6.000.000
6	4	No	7.500.000
10	5	Yes	18.000.000
12	5	No	15.000.000
14	6	No	18.000.000

$$\text{Salary} = \text{Experience} * \text{Magic\_Number\_1} + \text{JobLevel} * \text{Magic\_Number\_2} + \text{Skill} * \text{Magic\_Number\_3} + \text{Magic\_Number\_4}$$

# Application of Machine Learning

# How Machine Learning Help Businesses

# How can a machine learn?

- Machine learning algorithms work by searching through a set of possible prediction models for the model that best captures the relationship between the descriptive features and target feature in a dataset.

# Machine Learning Approach

- Error Based Learning
- Information-based Learning
- Similarity-based Learning
- Probability-based Learning

# Error Based Learning

- In error-based machine learning, Machine Learning perform a search for a set of parameters for a parameterized model that minimizes the total error across the predictions made by that model with respect to a set of training instances.

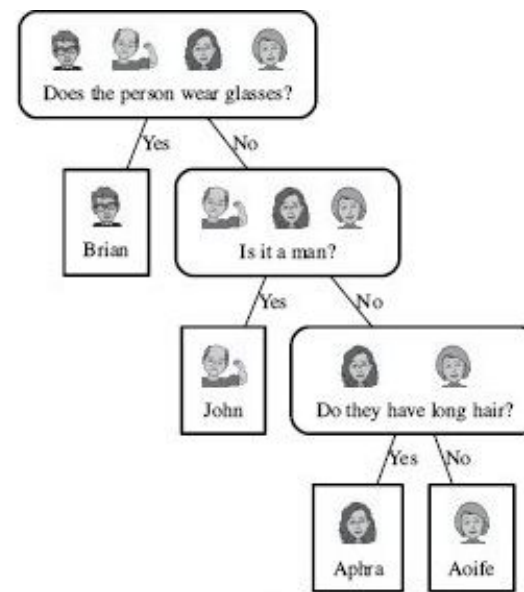

ID	SIZE	FLOOR	BROADBAND RATE	ENERGY RATING	RENTAL PRICE
1	500	4	8	C	320
2	550	7	50	A	380
3	620	9	7	A	400
4	630	5	24	B	390
5	665	8	100	C	385
6	700	4	8	B	410
7	770	10	7	B	480
8	880	12	50	A	600
9	920	14	8	C	570
10	1,000	9	24	B	620

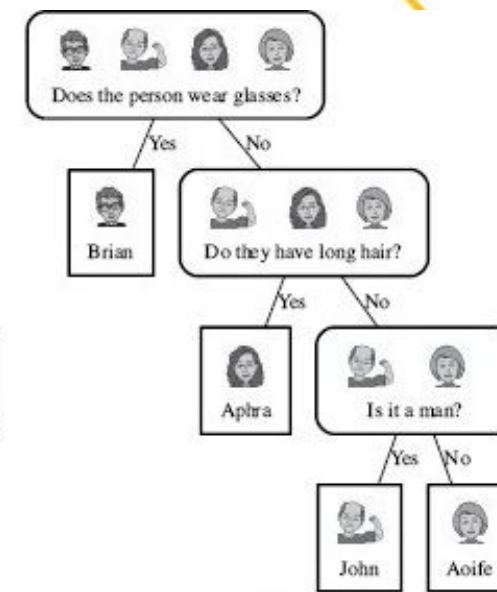

# Information Based Learning

Man	Long Hair	Glasses	Name
Yes	No	Yes	Brian
Yes	No	No	John
No	Yes	No	Aphra
No	No	No	Aoife

(a)

(b)

# Similarity Based Learning

- Similarity-based approaches to machine learning come from the idea that the best way to make a predictions is to simply look at what has worked well in the past and predict the same thing again.

	<i>Grrr!</i>			Score
	✓	X	X	1
	X	✓	X	1
	X	✓	✓	2

# Probability Based Learning

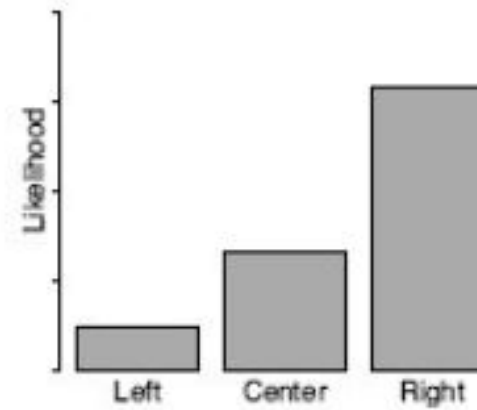

# Probability Based Learning

Initial Likelihood

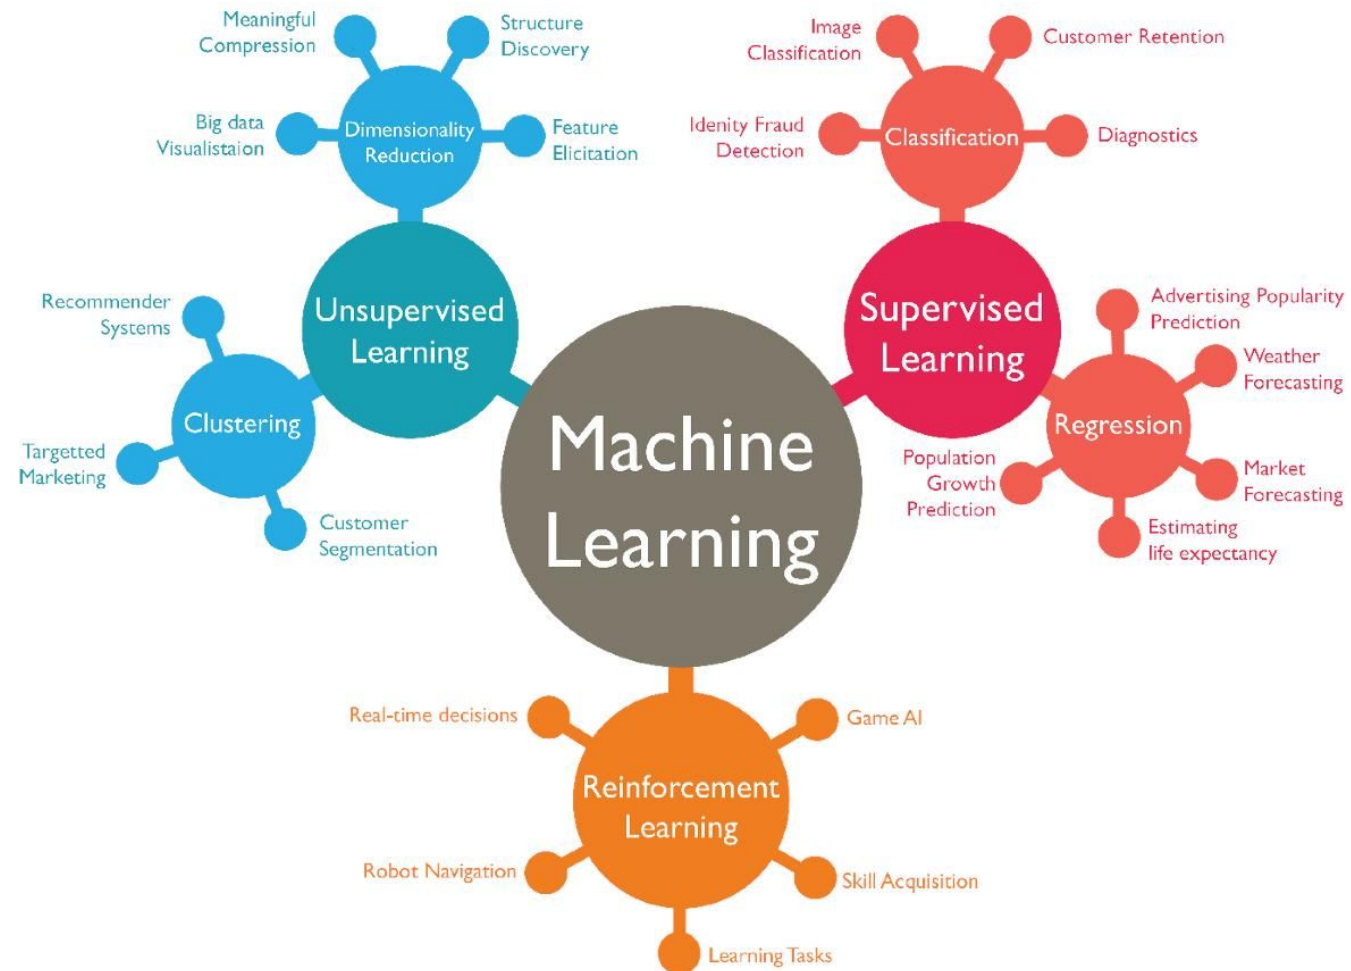

Revised Likelihood

# Type of Learning

- Supervised Learning.
- Unsupervised Learning.
- Reinforcement Learning.

# Type of Learning

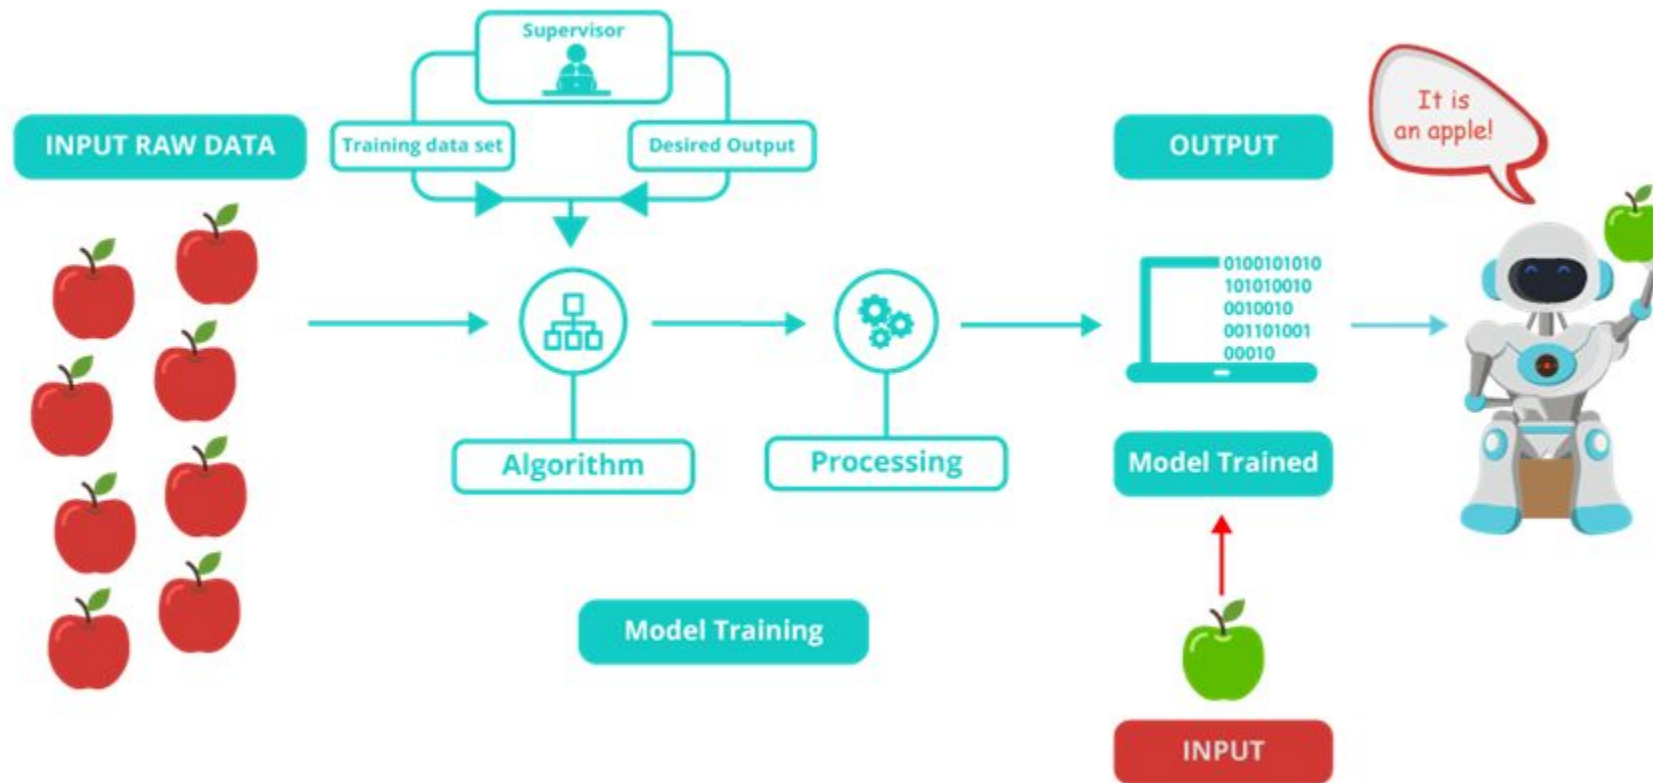

# Supervised Learning

- Supervised Learning approach is indeed like human learning under the supervision of a teacher. The teacher provides good examples for the student to memorize, and the student then derives general rules from these specific examples.

# Supervised Learning

# Supervised Learning Problem

- Regression : A regression problem is when the output variable is a real value, such as “weight” or “height.”
- Classification : A classification problem is when the output variable is a category or a group, such as “black” or “white” or “spam” and “no spam”.

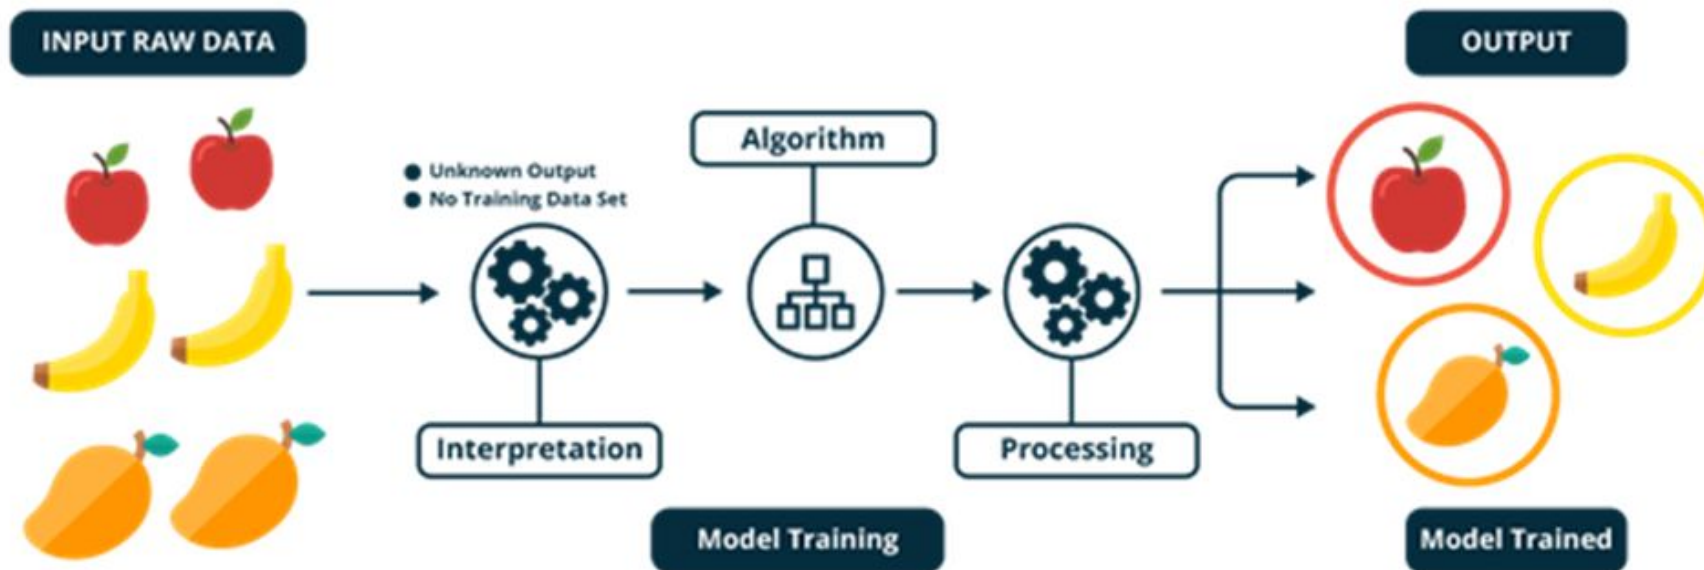

# Unsupervised Learning

- Mathematically, Unsupervised learning is where you only have input data ( $X$ ) and no corresponding output variables. The goal for unsupervised learning is to model the underlying structure or distribution in the data in order to learn more about the data.

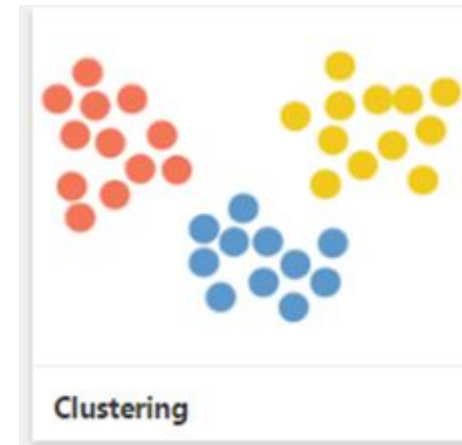

# Unsupervised Learning

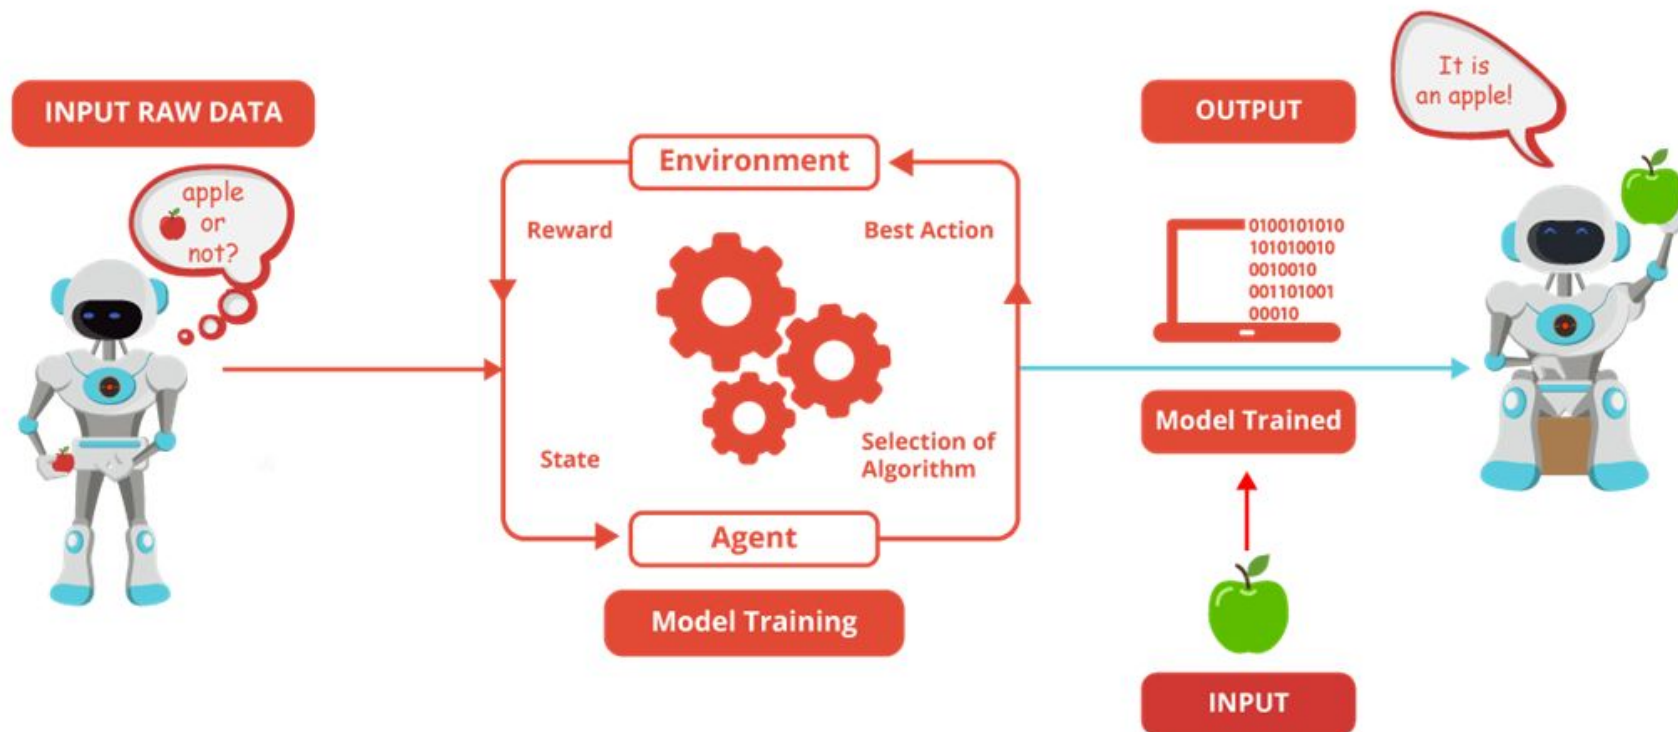

# Unsupervised Learning Problem

- **Clustering:** Grouping a set of objects in such a manner that objects in the same group are more similar than to those object belonging to other groups.
- **Association:** Finding associations amongst items within large commercial databases.

# Reinforcement Learning

# Machine Learning Steps

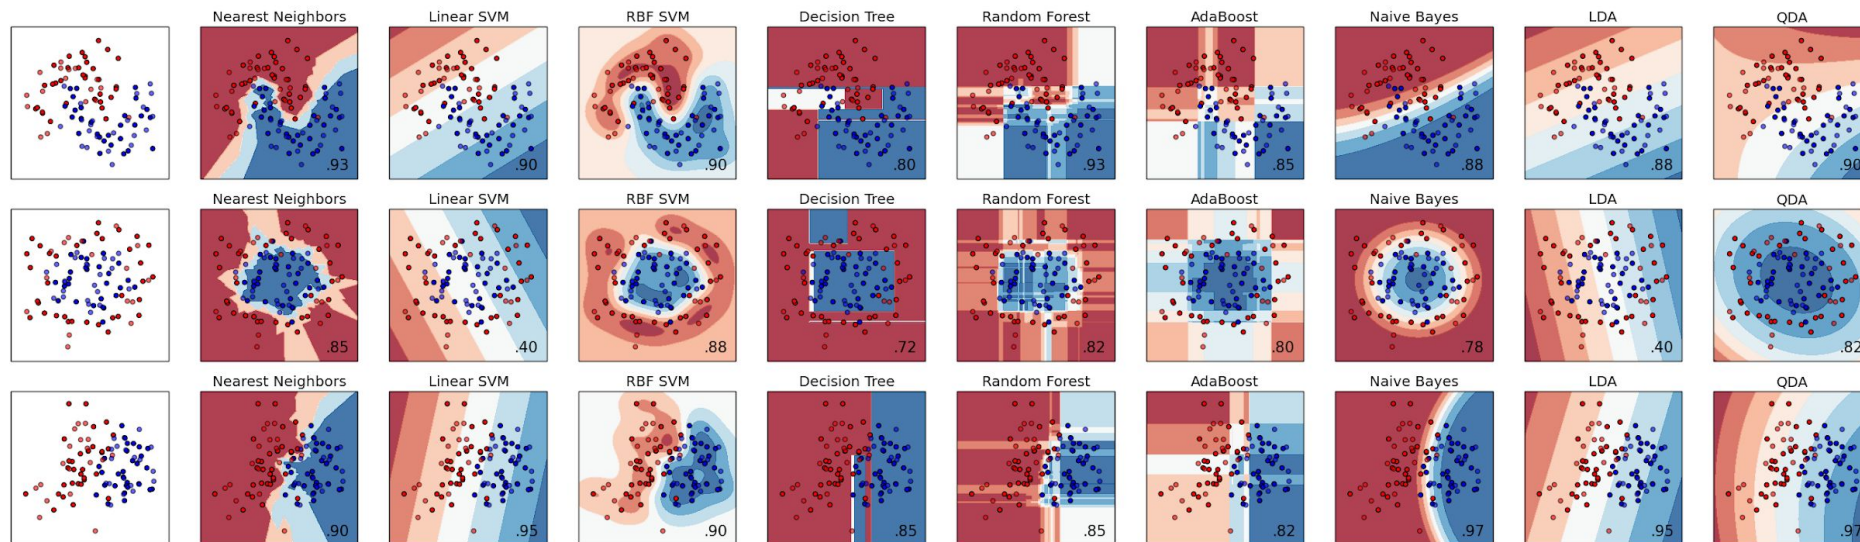

- Gathering Data
- Preparing that Data
- Choosing a Model
- Training
- Evaluation
- Hyperparameter Tuning

# Machine Learning Steps

# Overfitting and Underfitting

- Different machine learning algorithms encode different inductive biases. Because a machine learning algorithm encodes an inductive bias, it can induce models that generalize beyond the instances in a training dataset.

# Overfitting and Underfitting

- There are two kinds of mistakes that an inappropriate inductive bias can lead to: **underfitting and overfitting** .
- **Underfitting** occurs when the prediction model selected by the algorithm is too simplistic to represent the underlying relationship in the dataset between the descriptive features and the target feature.
- **Overfitting** occurs when the prediction model selected by the algorithm is so complex that the model fits to the dataset too closely and becomes sensitive to noise in the data.

# Overfitting and Underfitting

An **underfitted** model

A **good** model

An **overfitted** model

# Deep Learning

- Deep Learning is a subfield of machine learning concerned with algorithms inspired by the structure and function of the brain called artificial neural networks.

# Deep Learning

# Why use Deep Learning

# Machine Learning vs Deep Learning

## Classical Machine Learning:

- Interpretability and explainability are paramount
- Smaller amounts of relatively simple data
- Straightforward feature engineering
- Limited computational power
- Limited time, need for faster prototyping and operationalization
- Need for varied algorithm choices
- Accuracy of test dataset results is acceptable

## Deep Learning:

- Very high accuracy is a priority (and primes over straightforward interpretability and explainability)
- Large amounts of precisely labeled data
- Complex feature engineering
- Powerful compute resources available (GPU acceleration)
- Augmentation and other transformations of the initial dataset will be necessary

# Module Summary

- Machine Learning is a type of Artificial Intelligence (AI) that provides computers with the ability to learn without being explicitly programmed.
- There are 3 types of machine learning, named Supervised Learning, Unsupervised Learning, Reinforcement Learning.
- Supervised learning is like a teacher teach a student.
- Unsupervised learning is like a student learning by himself.
- Underfitting occurs when the prediction model selected by the algorithm is too simplistic to represent the underlying relationship in the dataset between the descriptive features and the target feature.

# Module Summary

- Overfitting occurs when the prediction model selected by the algorithm is so complex that the model fits to the dataset too closely and becomes sensitive to noise in the data.

# Assignment Week 3

- Find out the use of each type of Machine Learning in everyday life.
  - Write it as an article in Bahasa Indonesia
  - Post it on Medium, Blog, or other online writing media.
  - Not allowed to take other people's writings.
  - Make it as informative as possible
  - **Deadline: ???**
